Lecture (3): Python Basics

Python Collections (Arrays)

- ▶ There are four collection data types in Python:
 - ▶ **List** is a collection which is ordered and changeable. Allows duplicate members.
 - ▶ **Tuple** is a collection which is ordered and unchangeable. Allows duplicate members.
 - ▶ **Set** is a collection which is unordered, unchangeable, and unindexed. No duplicate members.
 - ▶ **Dictionary** is a collection which is ordered and changeable. No duplicate members.

Python Sets

- ▶ Sets are used to store multiple items in a single variable.
- ▶ A set is a collection which is *unordered*, *unchangeable*, and *unindexed*.
- ▶ Sets are written with curly brackets.
- ▶ Unordered
 - ▶ Means that the items in a set do not have a defined order. Set items can appear in a different order every time you use them, and cannot be referred to by index or key.
- ▶ Unchangeable
 - ▶ Cannot change the items after the set has been created. you can remove items and add new items.

▶ 3

by: Fatima Ben Lashihar

Python Sets

- ▶ Duplicates Not Allowed
 - ▶ Sets cannot have two items with the same value.
 - ▶ The values **True** and **1** are considered the same value in sets, and are treated as duplicates. As well as **False** and **0**.
- ▶ **len()** function to determine how many items a set has.
- ▶ Set items can be of any data type and can contain different data types
- ▶ the **set()** constructor is used to make a set

```
thisset = set(("apple", "banana", "cherry"))
```

by: Fatima Ben Lashihar

Access Set Items

- ▶ It **cannot** be accessed items in a set by referring to an index or a key.
- ▶ It can loop through the set items using a **for** loop
- ▶ The **in** keyword is used to ask for a specified value in a set

▶ 5

by: Fatima Ben Lashihar

Add Set Items

- ▶ **Once a set is created, its items cannot be changed, but new items can be added**
- ▶ To add an item to a set:
 - ▶ The **add()** method
 - ▶ the **update()** method (Note: The object in the update() method can be any iterable object)

▶ 6

by: Fatima Ben Lashihar

Add Set Items

```
collection = {"apple", "banana", "cherry"}
collection.add("orange")
print(collection)

tropical = {"pineapple", "mango", "papaya"}
collection.update(tropical)
print(collection)

mylist = ["kiwi", "orange"]
collection.update(mylist)
print(collection)
```

```
{'apple', 'banana', 'cherry', 'orange'}
{'banana', 'cherry', 'apple', 'papaya', 'pineapple', 'orange', 'mango'}
{'banana', 'cherry', 'kiwi', 'apple', 'papaya', 'pineapple', 'orange', 'mango'}
```

Remove Set Items

- The **remove()** method (the item to be removed must be exist)
- The **discard()** method
- The **pop()** method (the return value is the removed item)
- The **clear()** method
- The **del** keyword
- Using **pop()** method, which item will be removed?

► 8

by: Fatima Ben Lashihar

Loop and Join Sets

- ▶ The **for** loop to loop through the set items
- ▶ To join two or more sets in Python:
 - ▶ The **union()** method or **|** operator joins all items from two sets or more.
 - ▶ The **update()** methods joins all items from both sets.
 - ▶ The **intersection()** method or **&** operator keeps ONLY the duplicates.
 - ▶ The **difference()** method or **-** operator keeps the items from the first set that are not in the other set(s).
 - ▶ The **symmetric_difference()** method or **^** operator keep all items EXCEPT the duplicates.
- ▶ **Note:**
 - ▶ All operators only allow to join sets with sets, and not with other data types.
 - ▶ The update() changes the original set, and does not return a new set.
 - ▶ Both union() and update() will exclude any duplicate items.

▶ 9

Python Dictionaries

- ▶ Dictionaries are used to store data values in key:value pairs.
- ▶ A dictionary is a collection which is ordered, changeable and do not allow duplicates.
- ▶ As of Python version 3.7, dictionaries are *ordered*. But, in Python 3.6 and earlier, dictionaries are *unordered*.
- ▶ Dictionaries are written with curly brackets
- ▶ Changeable
 - ▶ Dictionaries are changeable, meaning that we can change, add or remove items after the dictionary has been created.
- ▶ Duplicates Not Allowed
 - ▶ Dictionaries cannot have two items with the same key

▶ 10

by: Fatima Ben Lashihar

Python Dictionaries

- ▶ `len()` function To determine how many items a dictionary has
- ▶ The values in dictionary items can be of any data type
- ▶ the `dict()` constructor is used to make a dictionary.

▶ 11

by: Fatima Ben Lashihar

Access Dictionary Items

- ▶ Accessing items by referring to its key name, inside square brackets or using the `get()` method
- ▶ The `keys()` method will return a list of all the keys in the dictionary.
- ▶ The `values()` method will return a list of all the values in the dictionary.
- ▶ The `items()` method will return each item in a dictionary, as tuples in a list.
- ▶ `in` keyword To determine if a specified key is present in a dictionary

▶ 12

by: Fatima Ben Lashihar

Change Dictionary Items

- ▶ You can change the value of a specific item by referring to its key name
- ▶ The `update()` method will update the dictionary with the items from the given argument that is a key:value pairs.

▶ 13

by: Fatima Ben Lashihar

Add Dictionary Items

- ▶ using a new index key and assigning a value to it
- ▶ The `update()` method will update the dictionary with the items from a given argument. **If the item does not exist, the item will be added.**

▶ 14

by: Fatima Ben Lashihar

Remove Dictionary Items

- ▶ The `pop()` method removes the item with the specified key name
- ▶ The `del` keyword removes the item with the specified key name or delete the dictionary completely
- ▶ The `clear()` method empties the dictionary

▶ 15

by: Fatima Ben Lashihar

Loop Dictionaries

- ▶ `for` loop to loop through a dictionary, the return value are the keys of the dictionary

▶ 16

by: Fatima Ben Lashihar

Copy Dictionaries

- ▶ `copy()` function
- ▶ `dict()` function

▶ 17

by: Fatima Ben Lashihar

Exercises

- 1) Update set1 by adding items from set2, except common, given:

```
set1 = {10, 20, 30, 40, 50}
set2 = {30, 40, 50, 60, 70}
```

- 2) Check if two sets have any elements in common. If yes, display the common elements, given:

```
set1 = {10, 20, 30, 40, 50}
set2 = {60, 70, 80, 90, 10}
```

- 3) Update the first set with items that don't exist in the second set, given:

```
set1 = {10, 20, 30}
set2 = {20, 40, 50}
```

- 4) Get the key of a minimum value from the following dictionary, given:

```
sample_dict = {
    'Physics': 82,
    'Math': 65,
    'history': 75
}
```

▶ 18

by: Fatima Ben Lashihar

Exercises

- 5) Get the key of a minimum value from the following dictionary, given:

```
sample_dict = {  
    'Physics': 82,  
    'Math': 65,  
    'history': 75  
}
```

- 6) Print the value of key 'history' from the below dict, given:

```
sampleDict = {  
    "class": {  
        "student": {  
            "name": "Mike",  
            "marks": {  
                "physics": 70,  
                "history": 80  
            }  
        }  
    }  
}
```

The END
