# 1-Introduction to JavaScript

## Introduction

- JavaScript is used to enhance the functionality and appearance of web pages.
- JavaScript is a client-side scripting language that runs entirely inside the web browser.
- All major web browsers contain JavaScript **interpreters**, which process the commands written in JavaScript.

## JavaScript Can

- Change HTML Content
- □ Change HTML Attributes
- □ Change HTML Styles
- Validate Data

### First JavaScript Example:

- Displaying a Line of Text with JavaScript in a Web Page
- We begin with a simple script that displays the text "Welcome to JavaScript Programming!" in the HTML5 document.

## document.write()

- The document object's write method
  - Writes a line of HTML5 text in the HTML5 document

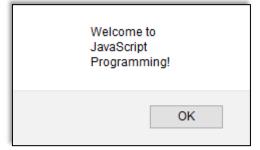

### statement terminator

• Every statement should end with a semicolon (also known as the **statement terminator**), although none is required by JavaScript

## Alert Dialog

- Dialogs
  - Useful to display information in windows that "pop up" on the screen to grab the user's attention.
  - Typically used to display important messages to the user browsing the web page.
  - Method alert requires as its argument the string to be displayed.

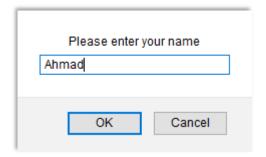

```
Welcome3.html
<!DOCTYPE html>
<html>
   <head>
      <meta charset = "utf-8">
      <title>Printing Multiple Lines in a Dialog Box</title>
      <script type = "text/javascript">
       alert("Welcome to\nJavaScript\nProgramming!");
    </script>
   </head>
   <body>
      Click Refresh (or Reload) to run this script again.
   </body>
</html>
```

## **Prompt Dialog**

- The prompt dialog allows the user to enter a value that the script can use.
- The next script creates a dynamic welcome page that obtains the user's name, then displays it on the page.

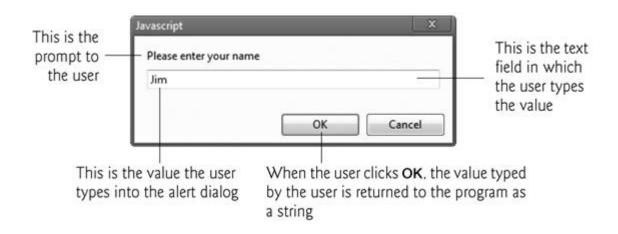

```
Welcome4.html
<!DOCTYPE html>
<html>
   <head>
       <meta charset = "utf-8">
       <title>Using Prompt and Alert Boxes</title>
       <script type = "text/javascript">
       var name;
       name = prompt( "Please enter your name" );
       document.write("<h1>Hello" + name + ", welcome to JavaScript
programming!</h1>");
    </script>
   </head>body>/body>
</html>
```

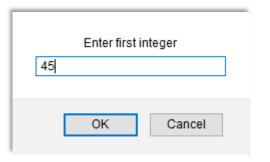

## Prompt Dialog (cont.)

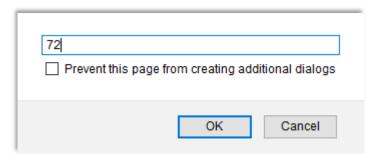

- The window object's prompt method displays a dialog into which the user can type a value.
  - The first argument is a message that directs the user to take a specific action.
  - The optional second argument is the default string to display in the text field.
- Script can then use the value that the user inputs.

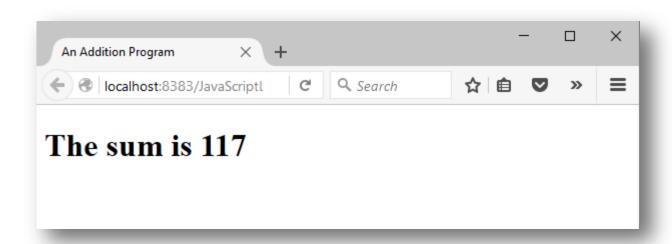

#### addition.html

```
<!DOCTYPE html>
<html>
 <head>
   <meta charset = "utf-8">
   <title>An Addition Program</title>
   <script type = "text/javascript">
     var firstNumber; // first string entered by user
     var secondNumber; // second string entered by user
     var number1; // first number to add
     var number2; // second number to add
     var sum; // sum of number1 and number2
     firstNumber = prompt("Enter first integer");
     secondNumber = prompt("Enter second integer");
     number1 = parseInt(firstNumber);
     number2 = parseInt(secondNumber);
     sum = number1 + number2; // add the numbers
     document.write("<h1>The sum is " + sum + "</h1>");
   </script>
 </head><body></body>
</html>
```

## Linking JavaScript to HTML

- ▶ In HTML, JavaScript code must be inserted between <script> and </script> tags
- JavaScript can be placed in the <body> and the <head> sections of an HTML page

## JavaScript in <head>

Using Scripts Within a Document Head by adding the JavaScript in <head>section.

```
<!DOCTYPE html>
 1
      <html>
         <head>
           <title>A First Program in JavaScript</title>
           <meta charset="UTF-8">
 5
           <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <script type = "text/javascript">
              document.writeln( "<h1>Welcome to JavaScript Programming!</h1>");
           </script>
         </head>
10
         <body> </body>
11
       </html>
12
```

# JavaScript in <body>

▶ The <script> tag in the HTML body indicates to the browser that the text which follows is a JavaScript.

```
<IDOCTYPE html>
      <html>
 3
         <head>
           <title>A First Program in JavaScript</title>
           <meta charset="UTF-8">
           <meta name="viewport" content="width=device-width, initial-scale=1.0">
         </head>
         <body>
           <script type = "text/javascript">
              document.writeln("<h1>Welcome to JavaScript Programming!</h1>");
10
           </script>
11
         </body>
12
       </html>
13
```

## External JavaScript

JavaScript Files can be placed in external files by using the following syntax:

<script src="myScript.js"></script>

### **Using Comments**

single-line comment

// This is a comment

multiline comments

/\* This is a section
of multiline comments
that will not be
interpreted \*/

### **Variables**

- JavaScript uses keyword var to declare a variable.
- Variables use the following rules:
  - A variable may include only the letters a-z, A-Z, 0-9, the \$ symbol, and the underscore (\_).
  - No other characters, such as spaces or punctuation, are allowed in a variable name. The first character of a variable name can be only a-z, A-Z, \$ , or \_ (no numbers).
  - Names are case-sensitive. Count, count, and COUNT are all different variables.

## **JavaScript Data Types**

 JavaScript variables can hold many data types: numbers, strings, arrays, objects.

## String Variables

JavaScript string variables should be enclosed in either single or double quotation.

> greeting = "Hello there" warning = 'Be careful'

You may include a single quote within a double-quoted string or a double quote within a single-quoted string.

greeting = "Hello 'there' "

#### **Numerical Variables**

Creating a numeric variable is as simple as assigning a value

### **Boolean Variables**

Boolean variable is used to hold on of the two values

isCorrect = true
isCorrect = false

### **Operators**

Operators in JavaScript can involve mathematics, comparison and logical operations.

#### 1. Arithmetic Operators

JavaScript provides the basic arithmetic operators.

j + 12
j - 22
j * 7
j / 3.13
sion remainder) j % 6
<b>++</b> j
j

#### 1. Assignment Operators

▶ The assignment operators are used to assign values to variables.

Operator	Example	Equivalent to
=	j = 99	j = 99
+=	j <b>+=</b> 2	j = j + 2
+=	j += 'string'	j = j + 'string'
-=	j -= 12	j = j - 12
*=	j <b>*=</b> 2	j = j * 2
/=	j <b>/=</b> 6	j = j / 6
%=	j %= 7	j = j % 7

#### 1. Comparison Operators

Comparison operators are generally used inside a control statement such as an if statement.

Operator	Description	Example
==	Is equal to	j <b>==</b> 42
!=	Is not equal to	j != 17
>	Is greater than	j > 0
<	Is less than	j < 100
>=	Is greater than or equal to	j >= 23
<=	Is less than or equal to	j <b>&lt;=</b> 13
===	Is equal to (and of the same type)	j === 56
!==	Is not equal to (and of the same type)	j !== '1'

#### 1. Logical Operators

26

JavaScript uses the following logical operators:

<b>Operator</b>	Description	Example
&&	And	j == 1 && k == 2
11	0r	j < 100 <b>  </b> j > 0
!	Not	! (j == k)

### **Conditionals**

Conditional are used to alter the program flow based on certain condition.

#### 1. if Statement

▶ The if statement t is used to choose among alternative courses of action in a script.

```
If-example.html
<!DOCTYPE html>
<html>
 <head>
   <title>if statement example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
 </head>
 <body>
   <script type = "text/javascript">
     a = 15;
     if (a < 100)
       document.write("a is less than 100");
</script>
 </body>
</html>
```

JavaScript Lecture-1 10/6/2016

28

#### 2. if ... else Statement

When a condition has not been met, you can execute an alternative by using an else statement.

```
If-else-example.html
<!DOCTYPE html>
<html>
 <head>
   <title>if...else example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
 </head>
 <body>
   <script type = "text/javascript">
     a = 105;
     if (a > 100)
       document.write("a is greater than 100");
     else
       document.write("a is less than or equal to 100");
   </script>
 </body>
</html>
```

#### 3. switch Statement

30

▶ The switch statement is a multiple-selection statement because it selects among many different actions, depending on the value of an expression

#### Switch-example.html

```
<!DOCTYPE html>
<html>
  <head>
    <title>To do supply a title</title>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
  </head>
 <body>
    <script>
     page = "About"
     switch (page)
       case "Home":
         document.write("You selected Home");
         break
       case "About":
         document.write("You selected About");
         break
       case "News":
         document.write("You selected News");
         break
       case "Login":
         document.write("You selected Login");
         break
       case "Links":
         document.write("You selected Links");
         break
       default:
         document.write("Unrecognized selection");
         break
   </script>
  </body>
</html>
```

#### 4. The? Operator

▶ The ? Operator combined with the : characters provides a quick way for doing if...else test.

## Looping

▶ Loops is used to execute a block of code a number of times.

#### 1. while Loops

A JavaScript while loop first checks the value of an expression and starts executing the statements within the loop only if that expression is true. If it is false, execution skips over to the next JavaScript statement.

#### While-loop-example.html

```
<!DOCTYPE html>
<html>
  <head>
    <title>While loop example</title>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-</pre>
scale=1.0">
  </head>
  <body>
    <script>
      counter = 0;
      while (counter < 5)</pre>
        document.write("Counter: " + counter + "<br>");
        ++counter;
    </script>
  </body>
</html>
```

JavaScript Lecture-1 10/6/2016

34

#### 2. do...while Loops

• do...while loop is similar to a while loop, except that the test expression is checked only after each iteration of the loop.

```
do-loop-example.html
<!DOCTYPE html>
<html>
  <head>
   <title>do loop example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
  </head>
 <body>
   <script>
     count = 1;
     do
       document.write(count + " times 7 is " + count * 7 + " < br > ");
     } while (++count <= 7)</pre>
   </script>
  </body>
</html>
```

#### 3. for Loops

36

- for loop is a single looping construct that uses three parameters for each statement:
  - An initialization expression
  - A condition expression
  - A modification expression

```
for-loop-example.html
<!DOCTYPE html>
<html>
 <head>
   <title>For loop Example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
 </head>
 <body>
   <script>
     for (count = 1; count <= 7; ++count)
       document.write(count + "times 7 is " + count * 7 + "<br>");
   </script>
 </body>
</html>
```

#### Breaking Out of a Loop

it is used to break out of a loop when certain condition is true.

```
Break-example.html
<!DOCTYPE html>
<html>
 <head>
   <title>break example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
 </head>
 <body>
   <script>
     colors = new Array();
     colors[17] = "Red";
     for (j = 0; j < 20; ++j)
       if (colors[j] == "Red")
         document.write("<br>>- Found at location " + j);
         break
        else
         document.write(j + ", ");
   </script>
 </body>
</html>
```

#### The continue Statement

38

It is used to skip the remaining statements just for current iteration of the loop.

```
continue-example.html
<!DOCTYPE html>
<html>
 <head>
   <title>continue example</title>
   <meta charset="UTF-8">
   <meta name="viewport" content="width=device-width, initial-scale=1.0">
 </head>
 <body>
   <script>
     colors = new Array();
     colors[4] = "Red";
     colors[11] = "Red";
     colors[17] = "Red";
     for (j = 0; j < 20; ++j)
       if (colors[j] == "Red")
         document.write("<br>>- Found at location " + j + "<br>");
         continue
       document.write(j + ", ");
   </script>
 </body>
</html>
```

# Thanks!
